

Shop Project App Summary

What it is

A Laravel web app for managing users, their assigned shops, and daily sales collections, with role-based admin and user dashboards.

Who it is for

Admins who manage shop assignments and reporting, and shop users who enter daily collection data.

What it does

- Role-based authentication with admin and user dashboards.
- Admin can create, edit, and delete users.
- Assign shops to users (single or bulk) with unique shop number checks.
- Record daily collections per shop with online/offline amounts and totals.
- View shop and collection reports; export shops and collections to Excel.
- Manage shops (view, update, delete) and see per-user shops.

How it works

- Routes in routes/web.php map to User, Admin, and DailyCollection controllers with auth/admin/user middleware.
- Eloquent models (User, Shop, DailyCollection) persist data via migrations and defined relationships.
- Blade views render UI; Excel exports use maatwebsite/excel package.

How to run

- composer install
- cp .env.example .env (if needed)
- Set DB credentials in .env: Not found in repo
- php artisan key:generate
- php artisan migrate
- npm install
- npm run dev
- php artisan serve
